

Building an AI – Powered Smart City to Improve Citizens’ Lives

MSCS 633 – Advanced Artificial Intelligence

Raghul Krishnan, Monica Pasupuleti, Kallol Chakraborty Shekhor, Syed Noor Ul Hassan, Mohammed Zakki Chand, Mohammed Uzer

Introduction

The rapid growth of urban populations in the 21st century has created major challenges, including traffic congestion, pollution, increased energy demand, and pressure on healthcare and housing. Traditional systems can’t keep pace — requiring smarter, technology-driven approaches.

By combining Artificial Intelligence (AI) and the Internet of Things (IoT), cities can evolve into efficient, sustainable ecosystems that respond intelligently to citizens’ needs.

This project presents a model for an AI-powered smart city integrating healthcare, transport, homes, energy, education, and governance under a unified ICT framework.

Essential Components

Sector	Key Smart Features	Impact
Healthcare	IoT wearables, AI Diagnostics, Predictive analysis	Early disease detection, preventive care
Transportation	IoT traffic sensors, AI traffic control, autonomous vehicles	Reduced congestion, improved safety
Energy	Smart grids, renewable energy, predictive load balancing	Efficient use, sustainability
Homes & Buildings	AI- based lighting, heating, security systems	Comfort, Safety, Energy savings
Education	AI-personalized learning, IoT classrooms	Equal access, improved performance
Governance	E-government, centralized data sharing	Data driven decision making

Resources Required

- Infrastructure: IoT sensors, 5G networks, cloud and edge computing.
- Human Capital: Data scientists, AI engineers, healthcare and cybersecurity professionals.
- Funding: Government grants, public–private partnerships, global tech collaborations.

Development TimeLine

- Years 1–5: Build ICT backbone, pilot healthcare and transport systems.
- Years 6–10: Expand projects citywide; integrate smart energy and education.
- Years 11–15: Refine and integrate systems; deploy autonomous and AI-driven operations.
- Years 16–20: Fully interconnected AI-powered city; citizen participation via AI platforms.

ICT framework

- Centralized data-sharing platform to ensure interoperability.
- AI-monitored systems enhance privacy and detect cyber threats.
- Evidence-based decision-making across all urban sectors for efficient service delivery.

Conclusion

An AI-driven smart city merges technology, sustainability, and human well-being. While resource-intensive, its long-term gains — improved living standards, energy efficiency, better governance, and citizen satisfaction — make it a sustainable model for future urban development.

Impact On Citizens

- Healthcare: Real-time monitoring and preventive care
- Mobility: Shorter commutes, cleaner air.
- Education: Personalized learning and digital inclusion.

Energy: Lower bills, greener systems.
Living: Smart homes and safe neighborhoods.
